## How It Works

Every AI action passes through constitutional enforcement before execution

### Fail-Closed by Default

Every request is denied unless explicitly authorized by policy. No ambiguity, no default-allow, no silent pass-through.

### Evidence on Every Action

Every governance decision produces a cryptographically linked evidence node. Append-only. Tamper-evident. Auditor-readable.

### Semantic Invariance

DELTASUM hashes lock data integrity. One bit changes, the system knows. No silent corruption, no unnoticed drift.

### Temporal Governance

KAIROS enforces time-windowed operations. Not just what is allowed — when it's allowed. Ethical compliance has a clock.

### Self-Testing

Adversarial audit simulation, chaos testing, claim-vs-runtime scanning. The system attacks itself to prove it holds.

### Regulatory Ready

Auto-generated compliance packs: EU AI Act Annex IV, ISO 42001, NIST AI RMF, SOC 2. From live runtime, not a spreadsheet.
